### Lyson Radial Adaptor Instructions for 224 and 2027 Extractors

Congratulations! This adapter set allows you to extract 12 medium or shallow frames radially in your existing square tangential basket. You can also extract four deep frames radially if desired.

**Setup:** First carefully remove the protective plastic sheeting from the adaptor plates. **Caution: some edges may be sharp.** Then, thoroughly wash plates with warm soapy water.

Place the adapter plates into the extractor basket (one at a time) with the edges of the sheet metal facing down. The center shaft will align with the half circle cutout on each plate. Your extractor is now ready for use.

**Extracting:** To extract, place two frames in each corner of the basket (parallel to diagonal support rod) with the top bar located in the corners of the basket. Place one frame in the middle of each side with the top bar facing outward. Be sure to evenly fill all four sides with frames so the extractor stays balanced.

**Cleanup:** Remove the adapter plates when cleaning the extractor. Clean adapter plates before putting them back in the extractor.
